Software design and engineering

Software Design and Engineering I selected an application I developed in CS 465: Full Stack Development named “Traveler Gateway”. This is a full-stack web app built with Node.js, Express, Handlebars, MongoDB and the MVC design. The app started out by letting individuals see photos of potential holiday places and read about trips.

My final assignment was to make the app easier to use, better structured, and better software design. The current MVC design was retained.

I wanted to make the app more enjoyable and user-friendly for everyone. I created a search tool that allows people to find excursions by tag, destination name, trip code, or amount of difficulty. I also enabled the sorting of the trips by price, time, or customer review.

I added quick buttons to make it easier to use. With this button you can rapidly see sites like trek trails, beaches, towns, or snowy areas. I also made it easier to use by adding photographs of the destinations, ratings from other customers, a segment that emphasized the places, trip details, and a calculator that gives you an estimate of how much a trip will cost.

I turned the controller into functions that can be reused to discover, sort, examine stats, and choose a featured location. This was done from the perspective of software engineering. That got rid of a lot of unnecessary code and made it easier to stay current. It also followed the MVC architecture's principle of dividing tasks.
